

SMASH PACKAGING

Packaging Sustainability Strategy

The SMASH Packaging Plan is part of our approach to a more responsible business. Let us know how we're doing and stay informed on our progress at sigmaaldrich.com/greener

MilliporeSigma is the U.S. and Canada Life Science business of Merck KGaA, Darmstadt, Germany.

Dear Customers, Colleagues, Partners and Stakeholders,

From life-saving therapies, diagnostics, and preventative solutions to more sustainable offerings and breakthrough technologies – we **impact life and health with science**.

At the core of this impact is one group of people: **customers, customers, customers**. As they drive scientific progress for their communities, they need our products to arrive quickly, efficiently, and safely. Our packaging must meet their requirements for sterile environments, temperature control conditions and protect our products as they traverse the world.

We also go beyond addressing these critical logistical demands by serving as a **sustainability multiplier** for our customers and collaborators. As we continue to reduce our environmental footprint, we help them achieve their own sustainability goals.

Our **SMASH Packaging** program is a key lever to reducing our footprint. With SMASH, we take a holistic approach to minimizing the environmental impacts of our packaging throughout its life cycle, without compromising on safety or quality. We aim to embed sustainability into every packaging decision to continue our progress on our sustainability targets. SMASH focuses on achieving three main goals:

- **Reduce** 10% of packaging weight per unit sales by 2030.
- 100% of fiber packaging to be **deforestation-free** by 2030.
- 100% of packaging to be designed following **circular design** principles by 2030.

With bold, methodical, **needle-moving actions**, we will continue to deliver breakthrough solutions for our customers, partners and stakeholders – creating a more sustainable tomorrow, together.

SMASH Packaging Strategy

From consultation with internal and external packaging and sustainability experts, we identified four pillars that are the foundations of our SMASH Packaging strategy. Based on these four pillars also known as the four S's, we set specific 2030 goals to drive more packaging sustainability across our organization and realize our packaging sustainability vision.

Since 2019, **OVER 100**
PACKAGING PROJECTS have been
COMPLETED or are **IN PROGRESS**

1,500+

metric tons of packaging
avoided annually
compared to 2020

81.6%

directly sourced fiber-based
packaging aligned with our
zero-deforestation standards

1,390+

metric tons of
packaging with
improved circularity

Reduce 10% of packaging weight per unit sales **by 2030.**

WHY?

Reducing overall packaging weight is considered a best practice across industries. Not only does it require less energy to create, but lighter packaging means lower shipping costs, decreased fuel consumption, and reduced materials which in turn, leads to reduced carbon footprint.

HOW?

- Explore existing packaging lightweighting opportunities, especially for high contributing packaging materials (i.e. wood, glass, corrugate, plastic).
- Eliminate unnecessary packaging components.
- Substitute packaging materials and designs with alternative ones that lead to packaging reduction.
- Investigate opportunities for reusable or bulk packaging solutions.
- Avoid the requirement of specific distribution packaging (i.e. cold chain or dangerous goods).
- Implement new processes and measures to minimize unused air space in distribution.

EXAMPLE

BULK PACKAGING FOR MILLISTAK+® PODS

Millistak+® HC, HC Pro, and Clarisolve Pods now have the option to be shipped through a bulk packaging solution. The new Bulk Packs consist of an innovative packaging system developed to optimize the number of units per pallet and reduce the amount of packaging compared to a single pack. Buying in bulk now offers between 33% to 53% less packaging waste depending on the product. It also leads to a significant reduction in operator time to open and manage the product and packaging.

100% of fiber packaging to be **deforestation-free by 2030.**

WHY?

Deforestation is a significant source of global warming and a threat to biodiversity, and demand for wood and fiber-based (i.e. paper or corrugated) packaging materials is a major driver of deforestation. We can reduce deforestation by using wood and fiber-based packaging that come from recycled material or that have sustainable forestry certification.

HOW?

- Identify deforestation risks in our wood and fiber packaging supply chain and take action to address these risks.
- Transition all wood and fiber packaging to be recycled, certified or from verified sources.
- Current progress is already underway with approximately 73% of our wood and fiber-based packaging that aligned with our zero deforestation standards.

EXAMPLE

IMPLEMENTATION OF SUSTAINABLE FORESTRY CERTIFICATION IN MOLSHEIM

We worked with our key corrugated vendors at our Molsheim site to progressively add sustainable forestry certification for most of our corrugated packaging materials. This represents approximately 1,000 tons of materials and more than 90% of the total amount of corrugated packaging used by the site annually.

100% of packaging to be designed following circular design principles by 2030.

SAVE

SWITCH

WHY?

Circular design principles consider every stage of a product's journey – before and after it reaches the customer, and is based on three principles, driven by design to: eliminate waste, circulate materials at their highest value, and regenerate nature.

HOW?

- Avoid use of material or treatments that are detrimental to recycling.
- Maximize use of or renewable and/or recycled content.
- Innovate packaging with solutions that maximize reusability or recyclability.
- Provide clear packaging recycling guidance.
- Initiate and develop reuse programs (i.e., pallets, steel drums, etc.).
- Create recycling programs to reduce internal packaging waste.

EXAMPLE

GREENER COOLER - AUSTRALIA

The EPS (expanded polystyrene) cooler has been replaced by a new cooler made of recyclable cardboard and certified home compostable insulation panels. These insulation panels are made of waste-sourced wool that is placed in a plastic liner. By using waste materials, we have developed new packaging to replace fossil-based materials.

CASE STUDIES

FOAM PEANUTS REPLACEMENT IN LYON

We replaced biodegradable starch peanuts with crumpled paper as filling material at the Lyon, France Distribution Center. The dunnage consists of 100% recycled paper. This substitution replaces 23 metric tons of foam peanuts annually, representing 2,900 cubic meters, the volume of 4 jumbo jets.

PACKAGING FOR SMALLS IN MILWAUKEE

A smaller box was developed and validated for shipping around 1,000 products daily at our Milwaukee distribution center. The new solution has an air space reduction of over 50%— a reduction of 60 metric tons of packaging materials annually.
